	Plots of Wing Normal Force Coefficient and Center of Pressure at $M = 1.5$ and 2.0	

SUMMARY

This report provides individual wing panel aero-dynamic characteristics (specifically, normal force coefficient and center of pressure location) for rectangular wings of three different aspect ratios (0.25, 0.75 and 1.00 each panel). Results are presented in the form of data plots at Mach numbers of 1.5 and 2.0 for angles of attack from 0 to 23 degrees and, for the most part, at aerodynamic roll orientations of 0 and 45 degrees. The wing with an aspect ratio of 1.00 is the same wing used in the flow field studies which are discussed in Part II of this report series.

INTRODUCTION

Knowledge of individual missile wing panel loads as a function of Mach number, angle of attack, and aerodynamic roll orientation is required by the theoretician in the development and verification of computational approaches to the definition of various aerodynamic flow phenomena. For example, wing loads, preferably experimental values, are required to formulate the effect of the wing downwash field on the lift of tail surfaces and on a certain portion of the missile body downstream of the wing trailing edges.

The purpose of this Part IV report is to provide wing normal force coefficients and center of pressure locations in the form of plots of experimental data for wing panels of aspect ratios 0.25, 0.75, and 1.0 (each panel) at Mach numbers of 1.5 and 2.0 for angles of attack to 23 degrees. These panels were chosen as a representative variation in one generic set of wing planform designs.

This report is the fourth in a four-part series published under the general title:

"Bumblebee Program - Aerodynamic Data".

Part I discusses the purpose of this effort and how the information in the other three reports is related.

Part II presents data at M = 2.0 which define the flow field around a concial-nosed, cylindrical missile body in a crossflow plane corresponding to a likely tail location.

Part III presents the Mach number effect (M = 1.5 and 2.0) on pressure fields only since complete flow field data are available in the Bumblebee Program at M = 2.0 only. This comparison is at a missile body station where a wing leading edge is likely to be located.

NOMENCLATURE

C _N , C _{N,p} , C _{N,w}	single panel normal force coefficient perpendicular to hub centerline in a plane perpendicular to body centerline	$= \frac{N_{w}}{qS_{w}}$
N _w	single panel normal force	(pounds)
s _w	area of one exposed wing panel	(sq.in.)
q	free stream dynamic pressure	(psi)
x _{cp} , x _{cp,w}	wing panel chordwise center of pressure from root leading edge	(% chord)
y _{cp}	wing panel spanwise center of pressure from root chord	(% single panel span)
y _{cp,w}	wing panel spanwise center of pressure from body centerline	(% panel span from body centerline)
α, α _c	angle of attack corrected for support deflection in vertical plane of the tunnel referred to tunnel centerline; nose up is positive	(degrees)
Ø	body roll attitude; positive is clockwise looking upstream ($\emptyset = 0$ when wings are horizontal and vertical)	(degrees)

The following coefficients are included in several data plots but will not be discussed in this report.

Ch,w
individual wing panel hinge moment coefficient

rolling-moment coefficient with respect to body
longitudinal axis from Stability and Control tests

$$y_{cp} = \frac{y_{cp,w} - 25.5}{0.745}$$

^{*}Applies for B_5W_4 data at M = 2.0 only. The following expression can be used to convert to y_{cp} (percent of single panel span).

C_{l,w}

rolling-moment coefficient with respect to body longitudinal axis, computed from instrumented wing panel data of wing hinge-moment tests.

For following definitions see Model Configuration Sketch (Fig. 1). Left

and Right denote the number 4 and 2 panels, respectively.

iw

wing deflection (incidence) on panels

(degrees)

2 and 4 with respect to body axis;

leading edge up is positive

i'w

wing deflection (incidence) on panels

(degrees)

1 and 3 with respect to body axis;

leading edge right is positive

 $i_w/i_w' = 0/-$, for example, denotes a planar configuration with panels 1 and 3 removed.

DISCUSSION

This Part IV report provides inidvidual wing panel aerodynamic characteristics (specifically normal force coefficient and center of pressure location) for rectangular wing panels with aspect ratios of 0.25, 0.75, and 1.0 (each panel) at Mach numbers of 1.5 and 2.0 for angles of attack to 23 degrees. The location of the wing leading edge is at the same mid-body station where the pressure fields at M = 1.5 and 2.0 are defined in Part III. Also, one of the wings (W4) included herein is the same as the one used in the complete flow field study (Part II) to determine the effect of wing downwash at a body station corresponding to a likely tail location. The location of these survey stations relative to the wing location is given by the model sketch in Fig. 1.

Source of Data

The normal force coefficients, and the chordwise and spanwise center of pressure locations are given in Appendix A in the form of data plots. These plots were reproduced from several reports of wind tunnel tests conducted as part of the overall Bumblebee Generalized Missile Study (GMS).* Some portions of these plots have been blanked out and other information added for clarity.

Sketchs of the wing planform are given in Fig. 1.

General Comments

Some notes concerning the plotted data of Appendix A follow.

- Actual wind tunnel data were plotted. No zero shifts were made.
- Data for wing deflections of 10° and 20° are exemplified for W₄
 at M = 2.0 only.
- Center-of-pressure data are questionable at low α due to hinge moment balance accuracy.

The Ordnance Aerophysics Laboratory (OAL) wind tunnel tests from which the wing panel data were obtained are: OAL Reports 289-4, -11, -12, -25, -26, "Investigation of Induced Roll and Longitudinal Stability Characteristics of a Generalized Missile Model at Mach Numbers of 1.5 and 2.0," 25 April, 5 and 6 August 1955.

- Spanwise center of pressure for the low aspect ratio wing (W_{30}) is erratic at all values of α and M, probably because of the large percentage of the wing area that is immersed in the non-uniform flow field near the body surface.
- The planar configuration (two panels) is obtained by removing the number 1 and 3 panels (see Fig. 1).
- It should be noted that data for the B_5W_4 configurations at M=2.0 were plotted in a different format compared to the rest of the data. Included in these plots are wing hinge moment coefficient and rolling moment coefficient. Neither of these coefficients will be considered in this Wing Loads report (see Nomenclature).

Examples

The data plotted in Figs. 2 and 3 exemplify how the data of Appendix A can be used.

Shown in Fig. 2 is the Mach number effect on the normal force coefficient for the largest of the wing panels (W_4) at a zero degree roll angle (see Fig. 1). It should be remembered that the reference area for $C_{N,p}$ is the single panel planform area.

The effect of wing panel aspect ratio (or panel span in this case) is shown in Fig. 3 for M = 2.0.

Another comparison that could be made but has not been shown is a planar versus a cruciform wing (W_4) at both Mach numbers which would give wing-wing interference effects.

The effect of aerodynamic roll orientation on wing panel characteristics is also included in the data plots of Appendix A.

CONCLUDING REMARKS

In summary, this report provides data plots that define the normal force coefficients and center of pressure locations for rectangular missile wings of three different aspect ratios at Mach numbers of 1.5 and 2.0. These plots will enable one to verify the theoretical methods over a range of aspect ratios which are commonly used in missile applications.

Proc*	included a fundamental rese	arch effort in	supersonic aeroc	lynamics as we	llas		
of a large amount of fundamental aerodynamic missile data, which has been stored for a number of years at the Applied Physics Laboratory. This report provides individual wing panel aerodynamic characteristics (specifically normal force coefficient and center-of-pressure location) for rectangular wings of three different aspect ratios (0.25, 0.75, and 1.00 each panel). 17. Key Words (Suggested by Author(s)) Missiles Pressure fields Missiles Pressure fields Missile data Missile configurations Wing loads Panel loads 18. Distribution Statement Unclassified - Unlimited Subject Category - 02 Subject Category - 02 19. Security Classif. (of this page) 20. Security Classif. (of this page) 21. No. of Pages 22. Pince*	a design task in developing	both vehicles	and prototypes o	of tactical mis	ssiles.
